

1           1. (Amended)       A circuit breaker comprising:

2           a main circuit formed by a power source-side terminal member, a fixed  
3           contact connected to said terminal member, a moving contact disposed in opposed  
4           relation to said fixed contact, a moving contact support member having said moving  
5           contact held on one end thereof, a coil operatively connected to said moving contact,  
6           and a load-side terminal member connected to said coil;

7           an opening/closing mechanism including a toggle mechanism for operating to  
8           rotate said moving contact support member so as to bring said moving contact into  
9           and out of contact with said fixed contact, when an excess current flows through said  
10          coil, and a fixed frame provided on a yoke of said coil to serve as a support base;  
11          and

12          a trip lever of a disengaging device, mounted on the yoke of the coil in the  
13          disengaging device, and being separated from said fixed frame of the  
14          opening/closing mechanism.

1           2. (Amended)       A circuit breaker according to claim 1, wherein said fixed  
2           frame, serving as a support base for said toggle mechanism, and said yoke are held  
3           by a case, and are disposed at different positions, respectively, such that an impact  
4           force, generated when said moving contact is in contact with said fixed contact by  
5           said toggle mechanism, is transmitted through the case to prevent occurrence of a  
6           mistrip.

1           3. (Amended)       A circuit breaker according to claim 2, in which said fixed  
2           frame is supported at two portions thereof on said case.
